- Dismounted-soldier systems for night combat, covert operations and counter-terrorism.
- Laser aiming devices, SWIR and night vision, uncooled thermal LWIR systems for assault, sniper and machine guns.
- Full technology stack — from semiconductor design to mission-grade battlefield solutions.

LASERS

BROLIS manufactures a broad range of laser systems designed for various applications, such as targeting, marking, illumination or designation. BROLIS LP5X is arguably the most popular laser aiming device in the NATO market, operating in 36 countries worldwide. Annual production exceeds 20 000 units.

THERMAL

BROLIS uncooled LWIR thermal solutions for dismounted soldier, border surveillance and UAV applications share latest VOx sensor technology and are suitable for weapon platforms from 5.56 mm to 12.7 mm.

NIGHT VISION

Night vision systems offered by BROLIS utilise the latest image intensifier technology, providing exceptional night vision performance. BROLIS profound expertise in semiconductor technology allows for the combination of night vision systems with out-of-band NIR illuminators, resulting in systems that are perfectly suited to covert operations.

SWIR TECHNOLOGY

BROLIS cutting-edge SWIR targeting and surveillance systems offer operators unprecedented tactical capabilities: night vision, visibility through various obscurants, such as dust or smoke, complete covertness from conventional night vision systems and the ability to illuminate through glass windows.

COUNTERMEASURES

BROLIS develops optics detection countermeasure solutions for telescopic sight users. These countermeasure systems not only allow the operator to remain undetected under the surveillance of optics detection systems but also protect the operator's eyes from harmful infrared laser radiation.
